8.1 = The determinant of a matrix A and its transpose A^t are equal
 $|A| = |A^t|$

For any operators $S, T \in A(V)$, $[T+S]_e = [T]_e + [S]_e$ and $[kT]_e = k[T]_e$ উদাহরকারীর স্বাক্ষর

বা: বি: প্রেস-১,৩০,০০০/১৪-০১-০৮/৫৫ প: নি: ০৬-০১-২০০৮

Theorem 7.2:— Let $\{e_1, e_2, \dots, e_n\}$ be a basis of V over K and let A be the algebra of n -square matrices over K . Then the mapping $T \mapsto [T]_e$ is a vector space isomorphism from $A(V)$ onto A .

That is, the mapping is one-one and onto and for any $S, T \in A(V)$ and any $k \in K$, $[T+S]_e = [T]_e + [S]_e$ and $[kT]_e = k[T]_e$

Proof:— The mapping is one-one since, by Theorem 8.1, a linear mapping is completely determined by its values on a basis. The mapping is onto since each matrix $M \in A$ is the image of the linear operator

$$F(e_i) = \sum_{j=1}^n m_{ij} e_j \quad i = 1, 2, \dots, n$$

where (m_{ij}) is the transpose of the matrix M .

Now, suppose, for $i = 1, 2, \dots, n$,

$$T(e_i) = \sum_{j=1}^n a_{ij} e_j \quad \text{and} \quad S(e_i) = \sum_{j=1}^n b_{ij} e_j$$

Let A and B be the matrices $A = (a_{ij})$ and $B = (b_{ij})$. Then $[T]_e = A^t$ and $[S]_e = B^t$.

$$\begin{aligned} \text{Now } (T+S)(e_i) &= T(e_i) + S(e_i) \\ &= \sum_{j=1}^n (a_{ij} + b_{ij}) e_j \end{aligned}$$

Clearly $A+B$ is the matrix $(a_{ij} + b_{ij})$.

$$\begin{aligned} \text{Accordingly, } [T+S]_e &= [(A+B)^t = A^t + B^t] \\ &= [T]_e + [S]_e. \end{aligned}$$

Also, we have, for $i = 1, 2, \dots, n$

$$\begin{aligned} (kT)(e_i) &= kT(e_i) = k \sum_{j=1}^n a_{ij} e_j \\ &= \sum_{j=1}^n (ka_{ij}) e_j. \end{aligned}$$

Clearly kA is the matrix (ka_{ij}) .

Accordingly, $[KT]_e = (KA)^t = KA^t = K[T]_e$.

~~Change of basis~~

Def. \therefore Let $\{e_1, e_2, \dots, e_n\}$ be a basis of V and

let $\{f_1, f_2, \dots, f_n\}$ be another basis.

Suppose $f_1 = a_{11}e_1 + a_{12}e_2 + \dots + a_{1n}e_n$

$$f_2 = a_{21}e_1 + a_{22}e_2 + \dots + a_{2n}e_n$$

$$f_n = a_{n1}e_1 + a_{n2}e_2 + \dots + a_{nn}e_n$$

Then the transpose P of the above matrix of coefficients is termed the transition matrix from the old basis $\{e_i\}$ to the new basis $\{f_i\}$.

$$P = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{pmatrix}$$

Since the vectors f_1, f_2, \dots, f_n are linearly independent, so the matrix P is invertible.

by $P \rightarrow 113$ problem 5.47 \therefore Consider the following two bases of \mathbb{R}^2 : $\{e_1 = (1, 0), e_2 = (0, 1)\}$ and $\{f_1 = (1, 1), f_2 = (-1, 0)\}$.

$$P = \begin{pmatrix} & \end{pmatrix} \text{ and } Q = \begin{pmatrix} & \end{pmatrix}. \quad PQ = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} = I$$

Theorem: 7.4: Let P be the transition matrix from a basis $\{e_i\}$ to a basis $\{f_i\}$ in a vector space V . Then for any vector $v \in V$,

$$P[v]_f = [v]_e \text{ and hence } [v]_f = P^{-1}[v]_e.$$

Proof: For, $i = 1, 2, \dots, n$, suppose

$$f_i = a_{i1}e_1 + a_{i2}e_2 + \dots + a_{in}e_n$$

$$= \sum_{j=1}^n a_{ij}e_j.$$

Then P is the n -square matrix whose j th row is $(a_{1j}, a_{2j}, \dots, a_{nj}) \longrightarrow \textcircled{1}$

Again, suppose

$$v = k_1f_1 + k_2f_2 + \dots + k_nf_n = \sum_{i=1}^n k_if_i$$

Then $[v]_f = (k_1, k_2, \dots, k_n)^t \longrightarrow \textcircled{2} \left[\begin{array}{l} \text{transpose of} \\ \text{a row vector} \end{array} \right]$

Also
Now, $v = \sum_{i=1}^n k_if_i = \sum_{i=1}^n k_i \left(\sum_{j=1}^n a_{ij}e_j \right)$

$$= \sum_{j=1}^n \left(\sum_{i=1}^n a_{ij}k_i \right) e_j$$

$$= \sum_{j=1}^n (a_{1j}k_1 + a_{2j}k_2 + \dots + a_{nj}k_n) e_j$$

Hence, $[v]_e$ is the column vector whose j th entry is $a_{1j}k_1 + a_{2j}k_2 + \dots + a_{nj}k_n \rightarrow \textcircled{3}$

On the other hand, the j th entry of $P[v]_f$ is obtained by multiplying ~~the~~ $\textcircled{1}$ and $\textcircled{2}$.

[But the product of $\textcircled{1}$ and $\textcircled{2}$ is $\textcircled{3}$ and hence $P[v]_f$ and $[v]_e$ have the same entries]

$$\text{Thus } P[v]_f = [v]_e$$

Also, multiplying $P[v]_f = [v]_e$ by P^{-1} gives $P^{-1}P[v]_f = P^{-1}[v]_e$

$$\text{i.e. } [v]_f = P^{-1}[v]_e$$

P 7.102
7.12, 7.13 [Theorem 7.3:— For any operators $S, T \in A(V)$, $[ST]_e = [S]_e[T]_e$]

Theorem 7.5:— Let P be the transition matrix from a basis $\{e_i\}$ to a basis $\{f_i\}$ in a vector space V . Then for any linear operator T on V ,

$$[T]_f = P^{-1}[T]_e P.$$

Theorem 7.1: Suppose $\{e_1, e_2, \dots, e_n\}$ is a basis of V and T is a linear operator on V . Then for any $v \in V$,

$$[T]_e [v]_e = [T(v)]_e.$$

Proof: For $i=1, 2, \dots, n$,

$$\begin{aligned} \text{suppose } T(e_i) &= a_{i1}e_1 + a_{i2}e_2 + \dots + a_{in}e_n \\ &= \sum_{j=1}^n a_{ij}e_j \end{aligned}$$

Then $[T]_e$ is the n -square matrix whose j th row is $(a_{1j}, a_{2j}, \dots, a_{nj}) \longrightarrow \textcircled{1}$

$$\begin{aligned} \text{Again suppose } v &= k_1e_1 + k_2e_2 + \dots + k_ne_n \\ &= \sum_{i=1}^n k_i e_i. \end{aligned}$$

$$\text{Here } [v]_e = \begin{pmatrix} k_1 \\ k_2 \\ \vdots \\ k_n \end{pmatrix} = (k_1, k_2, \dots, k_n)^t \longrightarrow \textcircled{2}$$

$$\begin{aligned} \text{Also, } T(v) &= T\left(\sum_{i=1}^n k_i e_i\right) = \sum_{i=1}^n k_i T(e_i) \\ &= \sum_{i=1}^n k_i \left(\sum_{j=1}^n a_{ij} e_j\right) = \sum_{j=1}^n \left(\sum_{i=1}^n a_{ij} k_i\right) e_j \\ &= \sum_{j=1}^n (a_{1j}k_1 + a_{2j}k_2 + \dots + a_{nj}k_n) e_j \end{aligned}$$

Hence $[T(v)]_e$ is the column vector whose j th entry is

Date

$$a_{1j}k_1 + a_{2j}k_2 + \dots + a_{nj}k_n \longrightarrow \textcircled{3}$$

On the other hand, the j th entry of $[T]_e[v]_e$ is obtained by multiplying the j th row of $[T]_e$ by $[v]_e$, i.e. $\textcircled{1}$ by $\textcircled{2}$.

But the product of $\textcircled{1}$ and $\textcircled{2}$ is $\textcircled{3}$.

Hence $[T]_e[v]_e$ and $[T(v)]_e$ have the same entries.

Therefore $[T]_e[v]_e = [T(v)]_e$.
